Docket No. IK-0088

Abstract of the Disclosure

A mounting structure for a receiving box of a refrigerator is provided. A storage space formed within a main body of a refrigerator includes a partitioned space which accommodates one or more receiving boxes. The receiving boxes each form a receiving space that is open at an upper face thereof for storing stuffs therein, and which are covered by a receiving chamber cover when the receiving boxes are closed. Guide rails are formed on the receiving chamber cover corresponding to inner sides of both sidewalls of the receiving boxes to allow the receiving boxes to be pushed into and taken out of the portioned space along guide flanges 41 formed along corresponding upper ends of both sidewalls of the receiving boxes. In this manner, the storage space provided by the receiving boxes is maximized, and an appearance of a front surface of the receiving boxes is improved.
